AQUARIUM

Aquarium User Guide

Working with your Aquarium assistant every day

Updated 2026-11-01

Contents

About this guide

1. Signing in

- 1.1 Your first sign-in
- 1.2 Signing in later
- 1.3 Two-factor login (recommended)

2. Finding your way around

- 2.1 The menu (Coral launcher)
- 2.2 The status bar

3. Chatting with the assistant

- 3.1 Approvals
- 3.2 Other ways to chat

4. Settings

5. Connected accounts

- 5.1 Google (Gmail, Calendar, Drive)
- 5.2 WhatsApp
- 5.3 Telegram
- 5.4 Extra tools and office network

6. Email mailboxes and polling

- 6.1 Adding a mailbox (IMAP / SMTP)
- 6.2 Email polling
- 6.3 Asking the assistant about your mail

7. To-dos, Inbox and Activity

- 7.1 To-dos
- 7.2 Inbox
- 7.3 Activity

8. Projects, Memory, Files and Tools

- 8.1 Projects
- 8.2 Memory
- 8.3 Files
- 8.4 Tools (apps the assistant built)
- 8.5 Agent webview

9. Skills

- 9.1 Reading websites that need a login (auth-web-crawler)

10. Roles and permissions

11. Admin functions (owner and admins)

11.1 Users
11.2 Get ready
11.3 Models
11.4 Tools & Integrations
11.5 Suggestions and goals
11.6 Backups and security (owner)

12. FAQ

About this guide

Aquarium is your organisation's AI assistant. It chats with you, reads the email and messages you connect, remembers what matters, keeps a to-do list, works on longer projects on its own, and files what arrives. This guide shows you how to use it in the browser.

The app works on a phone and on a computer. Web addresses in this guide use the example `https://home.example.com`; your organisation will give you the real one.

The app is available in **English** and **Traditional Chinese (□□□□)**.

1. Signing in

1.1 Your first sign-in

You do not choose a password for someone else, and nobody chooses one for you. Instead:

1. An owner or admin invites you and sends you a **one-time activation link**.
2. Open the link and choose your own password (at least 12 characters).
3. You are signed in.

The link works once. If it has expired or was already used, ask the person who invited you for a new one.

1.2 Signing in later

1. Go to `https://home.example.com/login`.
2. Enter your email and password.
3. If two-factor login is on, enter the 6-digit code from your authenticator app (or one of your recovery codes).

Forgot your password? Press **Can't sign in?** on the login page. An owner or admin then gets a one-time link they can hand to you.

1.3 Two-factor login (recommended)

Open **Settings → Account security**:

- **Turn on two-factor login**, scan the QR code with an authenticator app (Google Authenticator, Microsoft Authenticator, 1Password…), and type the 6-digit code to confirm.
- **Save your recovery codes.** Each one lets you sign in once without your phone. You can make new ones at any time; the old ones then stop working.
- **Change password** is also here.

2. Finding your way around

2.1 The menu (Coral launcher)

Open the menu from the launcher button. Apps are grouped into **Workspace** and **System**. Which apps you see depends on your role and on what the owner has chosen to show (Settings → Menu). **Home** and **Settings** are always there.

App	What it is for
Home	your starting point
To-dos	what needs you
Chat	talk to the assistant
Inbox	everything that arrived, plus approvals and the change log
Memory	what the assistant remembers
Projects	longer work the assistant runs on its own
Files	every file that arrived, and network folders
Activity	a timeline of what the assistant did
Graph	goals, tasks and how they connect (read-only)
Capacity	how busy the server is
Users	who is in your Aquarium
Suggestions	proposed new goals (owner decides)
Tools	apps the assistant built for you
Models	which AI model is used for what
Core area	the protected core settings (read-only)
Agent webview	watch and approve the assistant using a web browser
Settings	your account, connections and preferences
Getting started	readiness overview

2.2 The status bar

The small indicators show **CPU**, **Disk**, **Tokens** used in the last 30 days, active **Tasks**, and scheduled **Cron** jobs. Tap CPU to open the Capacity page.

3. Chatting with the assistant

Open **Chat**.

- **Type a message** and press send. The answer appears as it is written. While the assistant is working, a live activity line shows what it is doing (for example searching the web or reading a file).
- **Attach files** with the paperclip button (shown when file storage is set up). Attachments are included with your next message.
- **New conversation**: press **+ New**. Each conversation is kept separately; switch between them from the conversation list.
- **Archived** conversations are kept under the archive button.
- **Search** inside a conversation and across conversations; **filter** by tag.
- **Copy** a message with its copy button.
- **Profile picker**: if your Aquarium has more than one assistant (profile), choose which one answers. Each profile has its own memory, skills and conversations. If there is only one, the picker is hidden.

3.1 Approvals

Some actions are risky (for example running a command, or sending something on your behalf). The assistant then stops and asks. You can choose:

- **Approve** — this once,
- **Approve for this chat** — for the rest of this conversation,
- **Always approve** — from now on,
- **Deny**.

Pending approvals also appear in **Inbox → Approvals**.

3.2 Other ways to chat

If you connect Telegram or WhatsApp (section 5), you can talk to the same assistant from your phone's messaging app. It remembers you across all of them.

4. Settings

Settings contains:

Section	What you can do
Account security	password, two-factor login, recovery codes
Theme	light/dark look (saved in this browser)
Language	English or Traditional Chinese
Notifications	turn on push notifications on this device
In&Out	your connections: Google, WhatsApp, Telegram, email, VPN
Apps / Menu	which apps appear in the menu (owner sets this per role)
Tools & Integrations	the tools the assistant can use
Get ready	the setup checklist
Entity goal	what the whole system is for (owner edits)
Tags	create and delete tags used to organise items

Members and viewers see a reduced Settings page: they manage their own account and connections, not the system.

5. Connected accounts

Your connections are **private to you**. The assistant uses them only for you. Owner and admins can see *whether* you are connected, never your messages, files, keys or passwords.

The easiest place to start is **Settings → Get ready**. Under *Your connections* each item shows *Done*, *Needs attention* or *Not started*, with a **Set up** and a **Test** button.

5.1 Google (Gmail, Calendar, Drive)

The owner must first register Google for your Aquarium (see the Installation Guide). Then:

1. Open **Settings → In&Out → Connected accounts**.
2. Choose the services you want: Email, Calendar, Drive, or Full workspace (Drive, Docs, Sheets).
3. Open the Google link, sign in, and approve.
4. Your browser ends on a `localhost` address that does not load. **This is expected.** Copy the whole address from the address bar and paste it into Aquarium.
5. Check that the correct Google account is shown.

If Google warns "Google hasn't verified this app", that is normal for your organisation's own app: click *Advanced → Go to Aquarium*.

5.2 WhatsApp

1. **Settings → In&Out → WhatsApp**: type a short name (e.g. `work`) and press **Add bridge**.
2. On your phone: WhatsApp → Settings → Linked devices → Link a device, and scan the QR code.
3. Press **Send test**.

Restart fixes a stuck bridge. **Rebind** unlinks the phone and shows a new QR code. Use a business number: WhatsApp may block numbers that behave like bots.

5.3 Telegram

1. In Telegram, message **@BotFather**, send `/newbot`, and copy the token.
2. **Settings → In&Out → Telegram**: paste the token and press **Save and test**.
3. Press **Link my Telegram account**, press **Start** in Telegram, then **Check** in Aquarium.

The bot then answers only you.

5.4 Extra tools and office network

- **Extra tools**: add your own MCP servers (for example Notion). Only you can use them.
- **Office network (VPN)**: add your VPN login so the assistant can reach office file servers; then add network folders under **Files**.

6. Email mailboxes and polling

6.1 Adding a mailbox (IMAP / SMTP)

Use this for any mailbox: Outlook / Microsoft 365, your web host, or a company mail server.

1. **Settings → In&Out → Email (IMAP / SMTP) → Add mailbox**.
2. Pick a preset (Gmail, Outlook or Other). Presets fill in the server names and ports.
3. Fill in your email address, user name and password. Check the incoming (IMAP) and outgoing (SMTP) server, port and security. *Gmail and Outlook need an app password when 2-step sign-in is on.*
4. Press **Save and test**. Aquarium signs in to both servers (it does not send any mail).

The mailbox then shows one of:

- **Working** — both servers accepted the login,
- **Needs attention** — with the reason, e.g. wrong password,
- **Not tested yet**.

Use **Test** to check again, **Edit** to change details (leave the password empty to keep the saved one), and **Remove** to delete it. Your password is stored on the server and never shown again.

6.2 Email polling

Polling means Aquarium checks an inbox regularly by itself and files new mail into **Inbox**, where the assistant triages it (for example creating to-dos).

- **Gmail:** for a Google account connected with the Email service, the owner can switch **Email polling** on in **Connected accounts**.
- **IMAP / SMTP mailboxes:** the owner sees an **Email polling** checkbox under each of their own mailboxes in **Settings → In&Out → Email (IMAP / SMTP)**. Ticking it gives that mailbox the same polling and triage as Gmail. Aquarium logs in with the saved password. The checkbox is hidden from everyone else.

6.3 Asking the assistant about your mail

Once you have saved a mailbox (section 6.1), you can just ask in **Chat**. The assistant can list your mailboxes, search, read, send, reply, show your folders, mark mail as read or unread, flag it, and move it to another folder. For example:

- *"Search my unread mail."*
- *"Find emails from ada@example.com since last Monday."*
- *"Read the newest one and summarise it."*
- *"Reply to that email: thanks, Thursday works for me."*

- *"Mark it as read and move it to the Archive folder."*
- *"Send an email to team@example.com about tomorrow's meeting."*

If you have more than one mailbox, say which one (for example *"in my ops@example.com inbox"*). Before it sends or replies, the assistant checks the recipients and the text with you.

The assistant can only use **your own** mailboxes. It never uses anyone else's, and it never shows your password.

7. To-dos, Inbox and Activity

7.1 To-dos

The assistant notices things in what arrives (emails, messages, chats) and puts them on your to-do list:

- quietly as **staged** items, or
- as **open** items when they are worth interrupting you.

On **To-dos** you can promote, close or dismiss items and filter the list (for example `/todos?stage=open`). You are always the final judge.

7.2 Inbox

Inbox shows everything that arrived, from any channel, with filters. It also has:

- **Approvals** — actions waiting for your decision,
- **Change log** — changes the assistant made, many of which can be undone.

7.3 Activity

Activity is a read-only timeline of the assistant's interactions: what it was asked, which tools it used, and what came out. Use it to check what happened.

8. Projects, Memory, Files and Tools

8.1 Projects

Projects are longer-running pieces of work the assistant handles over time, for example a weekly report or an ongoing follow-up. The board shows active projects by category; filter by status or cadence. A project can be limited to certain tools and skills; the page shows what will actually run.

8.2 Memory

Memory shows what the assistant remembers about you and your work. Search it, page through it, and see it on a map. Memory is per person: your private memories are yours.

8.3 Files

Files lists every file that arrived from any channel (chat, email, WhatsApp…) with where it came from. A file only becomes part of memory when you ask, or when a triage skill decides. Network folders (via VPN) also appear here.

8.4 Tools (apps the assistant built)

The assistant can build small apps for you. **Tools** shows the ones you own and the shared ones, with their health.

8.5 Agent webview

When the assistant uses a web browser for you, **Agent webview** shows the session. Nothing happens without your consent: actions that need approval wait for you here.

9. Skills

A **skill** is a reusable set of instructions that teaches the assistant how to do a particular job well (for example "prepare a meeting summary" or "process an invoice"). The assistant chooses the right skill by itself; you do not need to start skills manually.

- **Ask for a skill in chat.** For example: *"Remember how you did this and make it a skill."* The assistant can create and improve its own skills.
- **Skills belong to a profile.** Each profile (assistant) has its own skills.
- **Projects** can be limited to certain skills (section 8.1).
- Operators can install and manage skills on the server with `hermes skills`.

9.1 Reading websites that need a login (auth-web-crawler)

The built-in **auth-web-crawler** skill lets the assistant sign in to a website you are allowed to use, look through it and pull out the content to study or summarise. Good examples are an intranet wiki, a supplier portal or a course site.

How to use it: in Chat, give the address, your login name and what you want. For example:

- *"Log in to https://portal.example.com with my login alice and summarise the pages under /docs."*
- *"Read the supplier price lists on our intranet wiki and make a table."*

Your password:

- If you send the password in chat, the assistant saves it right away in Aquarium's credential store (as `web-login/<site>`). After that it refers to it only by name, for example "the saved password for portal.example.com". Next time you only need to name the site.
- It never repeats your password, and never puts it in files, memory or output.

What it does and doesn't do:

- It stays on the same website, under the starting page. It visits a limited number of pages and follows the site's robots.txt rules. It skips "log out" and "delete" links.
- It saves the pages it read (title, text and links) so it can work with them.
- It refuses to send a password over plain `http://` unless you allow it.
- It **stops and asks you** at CAPTCHAs, two-factor codes or "verify it's you" pages. It does not get around them, or around paywalls.
- Only use it on sites you are authorised to access. If that is unclear, the assistant asks first.
- Addresses inside the office network (for example `10.x`, `192.168.x`) are blocked by default. Only your operator can allow them (see the Installation Guide, section 10).

10. Roles and permissions

Every person has one role.

Role	Typically for	Can	Cannot
Owner	one person	everything: settings, model keys, people, backups and security checks; their own connections	hand over ownership in the app (done on the server); read other people's private items unless senior access is on
Admin	office manager, IT	invite people and change roles; change settings, tools and model keys; use every assistant tool	make someone owner; set up backups; see or use anyone else's connections; read others' private items (with senior access: only members' and viewers')
Member	staff	chat; own private chats and files; everything shared; own Google, WhatsApp, Telegram, email, extra tools and VPN	see other people's private items; change settings; let the assistant run commands on the server
Viewer	part-time staff, guests	read what is shared; chat using the tools allowed for viewers	have the assistant write files; change settings; see other people's private items

Which menu apps each role sees is set by the owner in **Settings → Menu**. A hidden app is also blocked if someone types its address directly.

11. Admin functions (owner and admins)

11.1 Users

Users is a directory everyone can read. Owner and admins also see:

- **Invite**: enter email, display name and role. Copy the one-time activation link shown and send it to the person. It is shown only once; make a new one if it is lost (the old one stops working).
- **Change role** and **suspend** people.
- **CSV import**: upload `email,display,role` rows; preview, then apply.
- **Audit trail** of changes to people and roles.

11.2 Get ready

Settings → Get ready shows all eleven setup items plus each person's connection status (status only, never keys). **Test everything** checks them all.

11.3 Models

Models chooses the AI model for the main chat and for helper jobs (vision, summarising web pages, titles, approvals, tool routing…), sets **backup models** used when the main one fails, and shows usage and cost.

11.4 Tools & Integrations

In **Settings → Tools & Integrations** owner and admins enable, disable, test, remove and re-authenticate tool servers, and decide which tools each role's assistant may use.

11.5 Suggestions and goals

The owner sets the **Entity goal** in Settings. Aquarium may propose new sub-goals in **Suggestions**, one at a time; the owner adopts or dismisses each one (dismissal is permanent for that evidence).

11.6 Backups and security (owner)

Set up nightly encrypted offsite backups and run restore tests in **Get ready → Backups**. **Security basics → Test** runs read-only security checks. See the Installation Guide for details.

12. FAQ

I did not get an activation link. Ask the person who invited you; they can make a new one.

The activation or setup link says it is not valid. It was used already or has expired. Ask for a new one.

I lost my phone with the authenticator app. Sign in with a recovery code, then turn two-factor login off and on again in Settings → Account security to set up the new phone.

Can my manager read my email or chats? No. Connections and private items are yours. Owner and admins see only whether you are connected. (If the owner turns on *senior access*, owner and admins can read members' and viewers' private items; ask your owner whether it is on.)

Google shows "This site can't be reached" after I approve. That is expected. Copy the address from the address bar and paste it into Aquarium.

My mailbox says "Needs attention". The password is probably wrong or your provider requires an app password. Create one and edit the mailbox.

Can the assistant read or send mail from my mailbox? Yes, but only from the mailboxes you saved yourself, and it checks with you before sending. See section 6.3.

Can the assistant read a website that needs a login? Yes, if you are allowed to use the site. Give it the address and your login; see section 9.1.

The assistant does not answer. The AI model key may be missing or out of credit. Ask your owner or admin to check **Get ready → AI model**.

An app is missing from my menu. The owner may have hidden it for your role.

Why does the assistant ask before doing something? Risky actions need your approval. You can approve once, for the whole chat, or always.

Can I use it in Chinese? Yes. The app is available in English and Traditional Chinese.
